

# CONQUERING SKIN CANCER

## EDUCATION PACKAGE

Bring the multi-award winning film and resources into your class room

While skin cancer is rare in teens, sun damage accumulated during childhood and adolescence significantly increases the risk of skin cancer later in life, especially melanoma.

### GET ACCESS NOW

# WHY THIS MATTERS FOR YOUR STUDENTS

Skin cancer rates continue to rise around the world - over 90% of these can be attributed to intentional UV exposure. Increasing awareness and robust prevention measures offer effective ways to reduce the toll of skin cancer.

This education package inspires students to take up prevention measures and learn how to be part of the solution to end preventable skin cancers that impact 2 in every 3 Australians.

While skin cancer is rare in teens, sun damage accumulated during childhood and adolescence significantly increases the risk of skin cancer later in life, especially melanoma.

Teens tend to spend more time outdoors and make deliberate lifestyle choices, increasing unprotected exposure to the sun.

**Melanoma is the most common cancer diagnosed in adolescents and young adults.**

All Australians need to understand that sunburn is the result of damage to the skin. The single greatest risk factor for skin cancer is excessive exposure to UV and it is largely preventable by adequately protecting yourself from harmful UV.
